Technical Information B-RI 17

TIXOGEL

Rheological Additives for Organic Systems
TIXOGEL Formulations – Products and Applications

**Advantages for your product:**
- Easy handling
- No sagging
- No dripping
- Excellent storage stability
- No settling

**Advantages for your production processes:**
- Easy to meter
- Easy to disperse
- Universally applicable

TIXOGEL – Mode of Action

TIXOGEL is a thixotropic agent based on a laminar silicate with a hydrophobic coating. Once TIXOGEL has been dispersed and is evenly distributed in a paint or solvent, its tiny platelets interact to form a structure similar to that of a house of cards – this is what produces the gelling effect.

**Thixotropy**

Stirring destroys the card-house structure through a reversible process. Rapid stirring breaks down the card-house structure more quickly than does slow stirring. The gel will rebuild if allowed to stand for a period of time. In other words, the paint forms a gel during storage, which prevents it from settling. The paint however will become thinner upon stirring and can then be easily applied. The card-house structure slowly forms again after application, allowing the paint to level easily without sagging or dripping.

**Adding TIXOGEL to your product**

TIXOGEL may be added in the following forms:
- As powder
- As a traditional pregel in a solvent
- As a highly concentrated, pumpable pregel with a wetting agent as an activator

**Dispersion**

TIXOGEL must be fully dispersed in the product in order to optimize swelling and thixotropic effects. This means using highly effective shearing equipment such as a dissolver, a roller mill or other type of mill (colloidal, sand or ball mill).

The greater the amount of shear energy expended, the more effective gel formation will be. Elevated temperature also enhances dispersion.

**Activator**

Dispersion and gel formation are also supported by the addition of highly polar solvents (activators). These substances form a hydrogen bridge bond between TIXOGEL platelets, thereby increasing cross-linking and, consequently, viscosity. If no highly polar solvents are present in a formulation, a minimum amount must be added. (Adding too much, however, will reduce swelling once again.) Activators are typically added to paints at a concentration of 20–60 % of the amount of TIXOGEL used.
The following are some commonly used activators:

- Propylene carbonate or propylene carbonate/water (95:5)
- Methanol or methanol/water (95:5)
- Ethanol or ethanol/water (95:5)
- Other short-chain alcohols or acetone
- Wetting and dispersing agents, if necessary

Adding 5% water to the activator will increase its ability to form hydrogen bridge bonds, thereby making it more effective.

TIXOGEL: self-activating and easy to disperse

Theoretically, no additional activators are needed when using TIXOGEL MP 100, EZ 100 MP 250 as these products already contain activators. Nevertheless, adding small amounts of activator often improves performance. In non-aromatic, aliphatic solvents, for example, the addition of 10–20% activator is sometimes helpful, even when using pre-activated products. TIXOGEL may be added directly as a powder.

Adding TIXOGEL products

I. Traditional pregel:

Example:
- 88 to 92.5 parts white spirit
- 5 to 8 parts TIXOGEL
- 2.5 to 4 parts activator (such as ethanol/water (95:5))

Traditional pregel with higher levels of TIXOGEL may become too stiff and, as a result, cannot be pumped. In addition, solvent evaporation may cause these pastes to form crusts on their surfaces when stored over long periods of time.

Because these crusts are then very difficult to disperse, the use of modified pregels is common.

II. Modified pregels:

Example:
- 77.5 to 85 parts white spirit
- 10 to 15 parts TIXOGEL
- 5 to 7.5 parts wetting agent

Using a wetting agent as an activator or solubilizer for TIXOGEL makes it possible to prepare more highly concentrated pregels that are more readily dispersed and yet are still easy to pump.

The wetting agent prevents the paste from drying out and either keeps crusts from forming on the surface or ensures that any crusts that form can be readily dispersed.

III. Powder addition:

Ideally, TIXOGEL should be added to the solvent or solvent/binding agent mixture at the very beginning of the process. To prevent lump formation the activator should be added only when TIXOGEL has been fully wetted and dispersed.

Because TIXOGEL products readily disperse, TIXOGEL may be added in powder form when using a dissolver operated at a high shear rate or when the system is produced using a mill to complete dispersion after having added the powder in a high-speed agitator.

Products and Applications

BYK Additives

Product Range Additives:

- Additives to improve surface slip, leveling, and substrate wetting
- Adhesion promoters
- Defoamers and air release agents
- Processing additives
- Rheological additives
- UV absorbers
- Viscosity depressants
- Wax additives
- Wetting and dispersing additives for pigments and extenders

BYK-Chemie GmbH

Application Areas:

Coatings Industry
- Architectural Coatings
- Automotive Coatings
- Industrial Coatings
- Can Coatings
- Coil Coatings
- Wood & Furniture Coatings
- Powder Coatings
- Leather Finishes
- Protective & Marine Coatings

Plastics Industry
- Ambient Curing Systems
- PVC Plastisols
- SMC/BMC
- Thermoplastics

Printing Ink Industry
- Flexo Inks
- Gravure Inks
- Inkjet Inks
- Silk Screen Inks
- Offset Inks
- Overprint Varnishes

Paper Coatings
- Impregnation
- Coatings

Adhesives & Sealants

Construction Chemicals

Pigment Concentrates

Raw Materials for Manufacturing
Release Agents

BYK Instruments

BYK offers a complete line of testing instruments to meet your needs in many application areas:
- Gloss/Appearance
- Color

Portable or stationary laboratory equipment – including easy-to-use quality control software.

BYK instruments – the complete solution for the coatings and plastics industry.
