BYK Additives

PVC floors in top form

Not only people are frequently pushed to their limits in the field of sport and fitness. PVC floor coverings in related facilities must also be highly resilient. BYK wetting and dispersing additives, process additives or defoamers get synthetic materials such as PVC into top mechanical and optical shape as early as during their manufacture. BYK solutions are optimal in terms of homogeneous distribution and bonding of different solids, stabilizing coloring pigments and optimum viscosity. And this leads to genuine performance enhancement in terms of resilience, durability and color intensity.
